

WATER REPELLENT MASONRY

Concrete masonry with pre-sealing technology is manufactured with water repellent admixtures. These admixtures significantly reduce water absorption, and hence reduce the possibility of efflorescence, mould mildew or staining and ease of cleaning. The scientific breakthrough of pre-sealing technology means that the water repellent admixture incorporated during manufacture of the concrete product stays as an integral part of the concrete for its life.

Baines Masonry Blocks produces the majority of its colour products using this technology. We recommend a mortar additive to enhance the integrity of the mortar. The sealing agent is available for purchase at Baines Masonry.

For more information on this or to order mortar additive contact:
